WHAT ARE PFAS?

PFAS stands for per- and polyfluoroalkyl substances, which are a group of man-made chemicals used in a wide range of industrial and consumer products for their water and stain-resistant properties, as well as their ability to reduce friction.

PFAS can be found in a variety of everyday products such as non-stick cookware, food packaging, water-resistant clothing, firefighting foam, and even dental floss. They are persistent in the environment, meaning they do not break down easily and can accumulate in the soil, water, and in animals, including humans.

Exposure to PFAS has been associated with health problems, including developmental delays in fetuses and children, decreased fertility, increased cholesterol levels, and an increased risk of certain types of cancer. As a result, there is growing concern over the use and regulation of PFAS.
